Submersible Pump in Discharge Tube

Amacan P

Designation

Example: Amacan PA4 800-540 / 120 6UTG1

Key to the designation

Code	Description	
Amacan	Type series	
P	Impeller type, e.g. P = propeller	
A	Pressure class	
	A	
	B	
4	Number of vanes	
800	Nominal diameter of the discharge tube [mm]	
540	Nominal impeller diameter [mm]	
120	Motor size	
6	Number of motor poles	
	4	4-pole
	6	6-pole
	8	8-pole
	10	10-pole
	12	12-pole
UT	Motor version	
	UA	Without explosion protection, standard (sizes 500-270 ... 600-350)
	XA	Explosion protection to ATEX (sizes 500-270 ... 600-350)
	UT	Without explosion protection, standard (sizes 700-470 ... 1500-1600)
	XT	Explosion protection to ATEX (sizes 700-470 ... 1500-1600)
G1	Material variant	
	G1	Grey cast iron, standard material variant
	G3	Grey cast iron with Zn anodes, shaft made of 1.4057 stainless steel

Selection information

Information for pump selection

The guaranteed point of submersible pumps in discharge tubes is measured at a head 0.5 m above the motor (DIN 1184). The documented characteristic curves refer to this data. This must be taken into account when calculating system losses. The indicated heads and performance data apply to pumped fluids with a density $\rho = 1 \text{ kg/dm}^3$ and a kinematic viscosity ν of up to $20 \text{ mm}^2/\text{s}$.

The pump input power must be matched to the density of the fluid handled:

$$P_{2\text{req}} = \rho_{\text{fluid}} [\text{kg/dm}^3] \times P_{2\text{docu}}$$

The operating point with the largest pump input power is decisive for the operating range of the motor. To compensate the unavoidable tolerances of the characteristic curves of system, pump and motor we recommend selecting a motor size which provides sufficient power reserves.

Recommended minimum reserves¹⁾

Required pump input power [kW]	Motor power reserve	
	Mains operation	With frequency inverter
< 30	10 %	15 %
> 30	5 %	10 %

Intake chamber

Determine the minimum water level $t_{1\text{min}}$ (diagram in general arrangement drawing):

The minimum water level $t_{1\text{min}}$ is the water level required in the pump's suction chamber to ensure:

- that there is a sufficient liquid cover above the hydraulic system (propeller) (shown in diagram depending on pump size)
- that the pump does not draw in air-entraining vortices (shown in diagram depending on flow rate)
- that there is no cavitation in the hydraulic system (check against the $\text{NPSH}_{\text{required}}$ value indicated in the technical literature). The following conditions must be met:
 - $\text{NPSH}_{\text{available}} > \text{NPSH}_{\text{required}} + \text{safety allowance}$
 - $\text{NPSH}_{\text{available}} = 10.0 + (t_1 - t_3 - h_7/2)$
 - Safety allowance:
up to $Q_{\text{opt}} \Rightarrow 0.5 \text{ m}$
larger than $Q_{\text{opt}} \Rightarrow 1.0 \text{ m}$

Head (H)

The total pump head is composed as follows:

$$H = H_{\text{geo}} + \Delta H_v$$

H_{geo} (static head)

- Without discharge elbow – Difference between suction-side water level and overflow edge
- With discharge elbow – Difference between suction-side and discharge-side water level

ΔH_v (losses in the system)

- Starting 0.5 m downstream of the pump: e.g. pipe friction, elbow, swing check valve, etc.

1) If larger reserves are stipulated by local regulations or are required to compensate for uncertain factors in system calculations, these larger reserves must be provided.

Losses by inlet, riser and elbow

Losses are caused by the inlet, riser and elbow (or free discharge).

- Losses in the riser up to the indicated reference level (0.5 m above the motor) are taken into account in the documented characteristic curves.

- Inlet and elbow losses are system losses and must be taken into account for selection.
- For information on structural requirements, pump installation and pump sump design please refer to the KSB know-how brochure "Planning information: Amacan submersible pumps in discharge tubes" 0118.55.

Installation types

Overview of installation types

General arrangement drawings

BU type of installation (500-270 to 600-350)

- ①: Minimum water level (values see diagram on the following page)
- ②: Flow-straightening vane (⇒ Page 35)
- ③: Approach flow
- ④: Suction umbrella - Option for reducing the minimum water level t_1

Dimensions [mm]

Size	D	b	b ₁		b ₂		d ₇	d ₈	d ₉
			without suction umbrella d ₈	with suction umbrella d ₉	without suction umbrella d ₈	with suction umbrella d ₉			
500 - 270	508	750	150	–	150	–	400	505	650
600 - 350	610	1250	250	–	250	–	500	610	800

- 2) All dimensions for foundation recesses apply to discharge tube design without intermediate flange.
- 3) Always observe this dimension.
- 4) Value for maximum motor length

Dimensions [mm]

Size	d ₁₂	e ₁ ³⁾		h _a	h ₇	l _{min.}	m	p ₁	p ₂	t ₃ ³⁾	t _{4 min.} ⁴⁾
		without suction umbrella d ₈	with suction umbrella d ₉								
500 - 270	550	350	400	100	295	400	600	700	440	200	1600
600 - 350	650	400	500	100	540	850	700	800	540	320	1900

t₂ = 1.1 x water level, maximum 2 x t₁
Height of corner lining (b₁ and b₂) like t₂

Permissible tolerances:

- Tolerances in building construction to DIN 18202, Part 4, Group B
- Welded design: B/F to DIN EN ISO 13920
- Tolerances for conical seat (detailed view Y): ISO 2768-mH

Loss diagram

Loss diagram

Calculation formulas:

$H = H_{geo} + \Delta H_v$

ΔH_v

- Overflow head h_ü (see diagram)
- Loss in the riser (pipe friction)
- Outlet loss $v^2/2g$ (v refers to D_A)

Overflow head h_ü depends on Q and the discharge diameter D_A. The characteristic curve values only apply to unimpeded outlet in all directions; otherwise they are approximate values only.

Permissible tolerances:

- Tolerances in building construction to DIN 18202, Part 4, Group B
- Welded design: B/F to DIN EN ISO 13920
- Tolerances for conical seat (detailed view Y): ISO 2768-mH
- Discharge flanges to ISO 7005/2, DIN 2501 PN6

Loss diagram

Calculation formulas:

$$H = H_{geo} + \Delta H_v$$

ΔH_v

- Loss in the elbow h_{vKr} (see diagram)
- Loss in the riser (pipe friction)
- $H_{V,system}$ (valves, etc.)

$H_{V,system}$ must be determined for the specific system.

- 4 - Amacan P 800/900 - 540
- 5 - Amacan P 1000 - 700
- 6 - Amacan P 1200 - 870
- 7 - Amacan P 1500/1600 - 1060

Dimensions of the flow-straightening vane

Design of the intake chamber wall surfaces (to prevent vortex formation)

The flow-straightening vane is indispensable for the inlet conditions of the pump set. It prevents the development of a submerged vortex (floor vortex) which could cause a drop in performance, for example. In addition, the floor and wall surfaces of the intake chamber should be designed as a rough concrete surface. Rough surfaces minimise the separation of boundary layers that may cause wall and floor vortices.

Flow-straightening vane and intake chamber

- The anti-vortex vanes in the bellmouth must be aligned with the flow-straightening vane.
- The bail of the pump is oriented in the same direction as the anti-swirl baffles in the bellmouth.

Fig. 1: Installation position of the pump set

1	Bail
2	Anti-vortex vanes
3	Flow-straightening vane

Variant 1
Flow-straightening vane cast from concrete

Variant 2
Steel section

A	Bolted to the floor of the intake chamber
B	Flow-straightening vane centred beneath the discharge tube
C	Discharge tube
D	Intake chamber

Installation types BU, CU, DU
